Q1 : Define the tech stack you'd use & why you picked that stack ?

I choose **React.js for frontend** because its current, quick, and component-driven UI framework. Its also perfect for active user interfaces and state handling with hooks. I choose **Node.js/Express.js for backend** because its streamlined, non-blocking backend that works effortlessly with MongoDB. excellent for developing REST APIs. I choose **MongoDB for database** because of its Versatile NoSQL database, ideal for managing nested documents such as user tasks, categories, and reminders. The main reason were Node-cron & nodemailer (npm packages) because these packages are very efficient in case of email & scheduling.

Q2 : ER Diagram

Q3 : high-level architecture diagram
